Connecting to the Internet

To connect to the Internet, you need:

A modem and telephone line, or a LAN connection

A Web browser

An Internet Service Provider (ISP) account

The Microsoft

automatically configured on your system so that when

you

first start it, it guides you through signing up for a new ISP

account, or assists you in setting up your computer to work

with your existing ISP.

Once you have established an ISP account, you can connect

to the Internet.

1

Connect your computer's modem to a telephone line.

For more information on connecting a modem, see

["Connecting the modem to a telephone line"](#) on

[page](#)

2

Start your Web browser. Have your modem dial the ISP's telephone number, and establish a connection with the ISP's computer.

If you are using your computer at the office, then you probably connect to the Internet through your company's network. See your network administrator about

connecting to

the Internet.

Surfing the Internet

Once connected to the Internet, the Web browser displays a

home page, for example, your ISP's home page on the Internet or your company's Web site home page.

To visit a desired Web site, type in the Web address. The Web address, or Uniform Resource Locator (URL), is a unique identifier for that computer system linked to the Internet.

Web

addresses can also appear within a Web page's text, and are

known as links. Clicking a link automatically transfers your

Web browser to that site.

Exploring Your Computer's Features

An overview of using the Internet

®

Web browser Internet Explorer is
130.
