Small bright dots may appear on your screen display when you turn on your computer. Your display contains an extremely large number

---

of thin-film transistors (TFT) and is manufactured using high-precision technology. Any small bright dots that may appear on your display are an intrinsic characteristic of the TFT manufacturing technology. Over a period of time, and depending on the usage of the computer, the brightness of the screen will deteriorate. This is also an intrinsic characteristic of the screen technology. When the computer is operated on battery power, the

screen will dim and you may not be able to increase the brightness of the screen while on battery power.
