LIGHTING THE BURNERS

- To ignite one of the burners, turn the relative knob anti-clockwise to the maximum flame setting
- Press the knob against the control panel to ignite the burner
- After the burner has ignited, keep the knob pressed for about 5 seconds to allow the thermocouple to warm up. This burner safety device shuts off the gas supply to the burner if the flame goes out accidentally (because of sudden draught, an interruption in the gas delivery, boiling over of liquids, etc.).
- The device must not be pressed for more than 15 sec. If, after that time has elapsed, the burner does not remain lit, wait at least one minute before trying to light it again.
- The burner might go out when the knob is released. This means that the thermocouple has not warmed up enough. In this case, repeat the operations described above.

PRATICAL ADVICE FOR USING THE BURNERS
For better burner performance, please stick to the following rules:

- Use pots and pans that fit the burners (see table on the right).
 - Only use flat-bottomed pots and pans.
 - Use the correct amount of water for cooking foods and keep the pot covered.
 - In the case of pans with convex bottoms (WOK), use the support grille provided, which should be positioned only on the 4 ring burner.
- Due to continued product development, Whirlpool reserves the right to change specifications or model availability without notice.
