Capacity Control; Current Release Control - Toshiba RAS-13SKV-E Service Manual

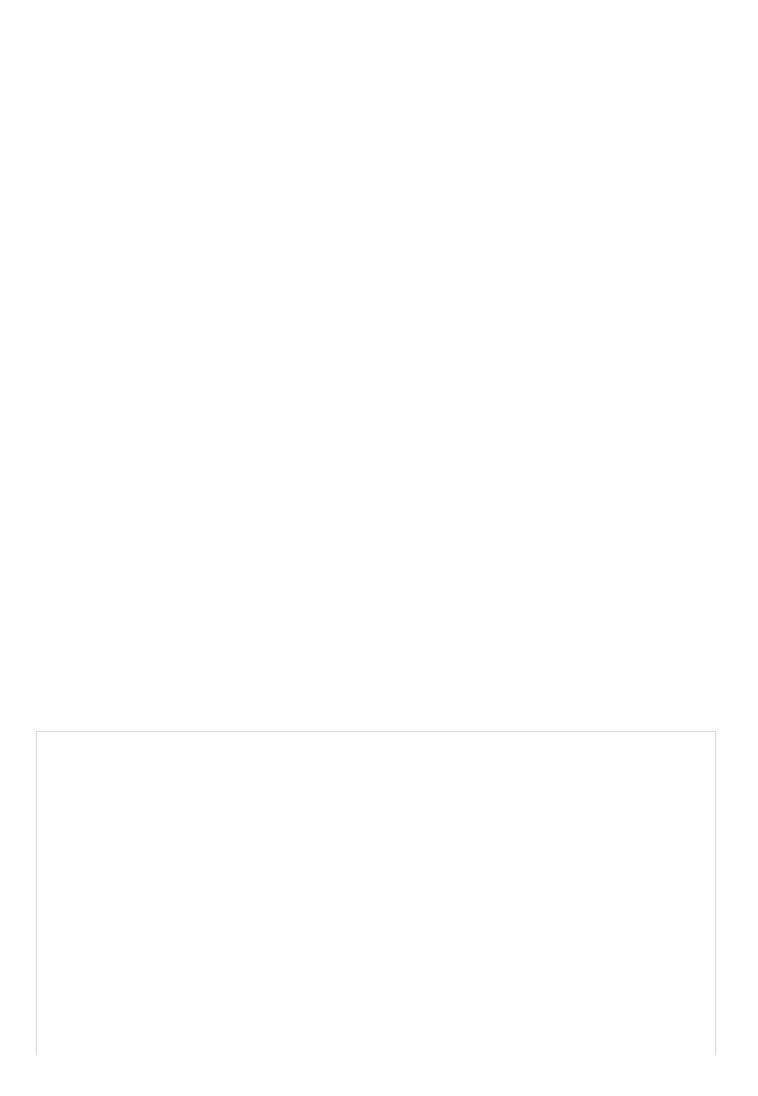

Indoor/outdoor unit, split type air conditioner

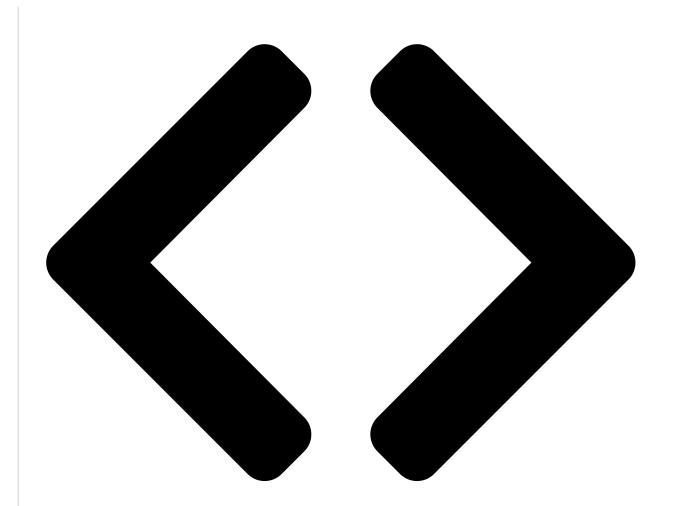

1	1	9
1	2	0

Table of Contents

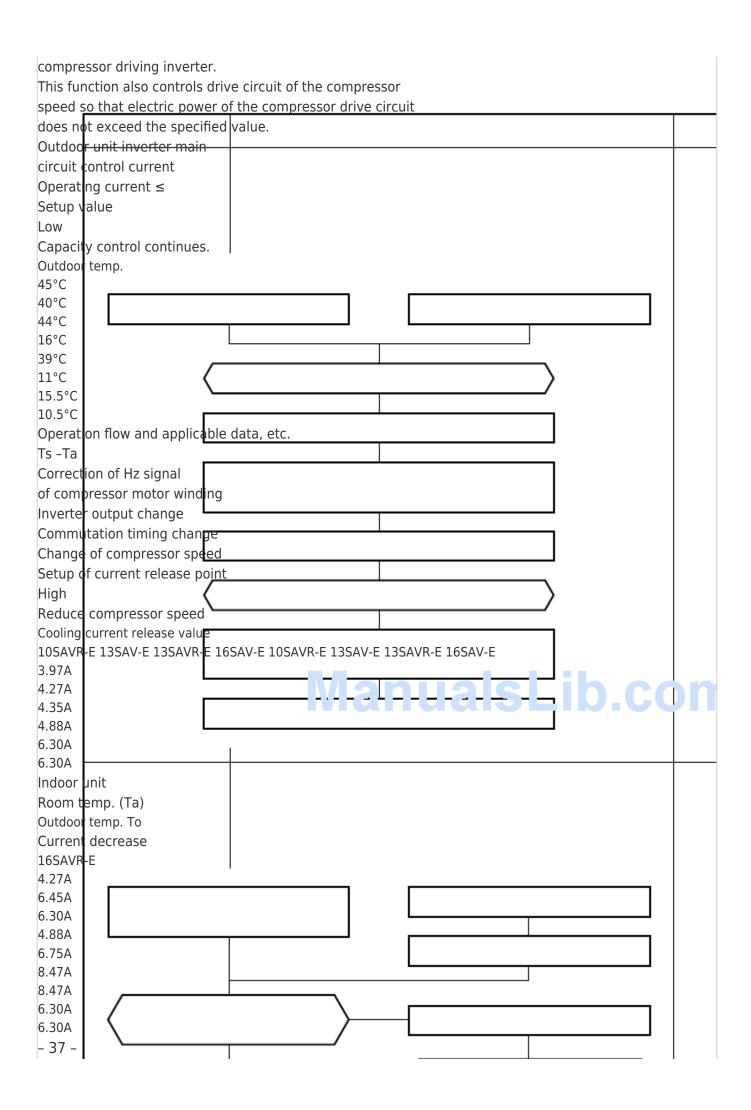

Item	
4. Capacity	
The cooling or heating capacity depending on the load is	
control	
adjusted.	
According to difference between the setup value of tempera-	
ture and the room temperature, the capacity is adjusted by	
the compressor revolution.	
Remote controller	
Set temp. (Ts) Detection of electromotive force	
Detection of motor speed and rotor position	
Correction value of Hz signal ≤ Operating Hz	
5. Current release	
This function prevents troubles on the electronic parts of the	
control	

1) The difference between set temperature on remote controller (Ts) and proof the temperature (Ta) is calculated. 2) According to the temperature difference, the correction value of Hz signal which determines the compressors speed is set up. 3) The rotating position and speed of the motor are detected by the electromotive force occurred on the motor winding with operation of the compressor. 4) According to the difference resulted from companison of the correction value of Hz signal with the present operation Hz, the inverter output and the commutation timing are varied. 5) Charge the compressor motor speed by outputting power to the compressor. **The Ontents of control operation are same in cooling operation and heating operation are same in cooling operation are same in cooling operation of the outdoor unit. 2) According to the detected outdoor temperature, the specified value of the current value exceeds the specified value of the current value exceeds the specified value, this function reduces the compressor speed up to the closest one commanded from the indoor unit within the range which does not exceed the specified value. Heating current release value 165A/A/HE	Description	
(TS) and room temperature (Ta) is calculated. 2) According to the temperature difference, the correction value of Hz signal which determines the compressor speed is set up. 3) The totating position and speed of the motor are detected by the electromotive force occurred on the motor winding with operation of the compressor. 4) According to the difference resulted from comparison of the correction value of Hz signal with the present operation Hz, the inverter output and the commutation timing are varied. 5) Change the compressor motor speed by outputting power to the compressor. *The contents of control operation are same in cooling operation and heating operation and heating operation and heating operation and heating operation of the outdoor unit. 2) According to the detected outdoor temperature, the specified value of the current value exceeds the specified value of the current value exceeds the specified value, this function reduces the compressor speed and controls speed up to the closest one compressor speed and controls speed up to the lesson of the not speed up to the lesson of the not speed up to the lesson on the specified value. Heating current release value 1630A7 E 630A7. **Trana **Tra	1) The difference between set	
is calculated. 2) According to the temperature difference, the correction value of Hz signal which determines the compressor speed is set up. 3) The rotating position and speed of the motor are detected by the electro motive force occurred on the motor vimiding with operation of the compressor. 4) According to the difference resulted from comparison of the correction value of Hz signal with the present operation Hz, the inverter output and the commutation timing are varied. 5) Charge the compressor motor speed by outputting power to the compressor. * The contents of control operation are same in cooling operation and heating operation and heating operation of the outdoor unit is elected in the invester section of the outdoor unit. 2) According to the detected outdoor temperature, the specified value of the current value exceeds the specified value of the current value exceeds the specified value, this function reduces the compressor speed and controls speed up to the closest one commanded from the indoor unit within the range which does not exceed the specified value. Heating current release value 165A9VF. 6.30A 7.772A	temper <u>ature on remote controller</u>	
2) According to the temperature difference, the correction value of Hz signal which determines the compressor speed is set up. 3) The fotating position and speed of the motor are detected by the electro motive force occurred on the motor winding with operation of the other compressor. 4) According to the difference resulted from comparison of the correction value of Hz signal with the present operation Hz, the inverter output and the commutation timing are varied. 5) Change the compressor motor speed by outputting power to the compressor. *The cyntents of control operation and heating operation and heating operation and heating operation and heating operation. 1) The Input current of the butdoor unit is effected in the invariant section of the outdoor unit. 2) According to the detected outdoor temperature, the specified value of the current value exceeds the specified value of the current value exceeds the specified value, this function reduces the compressor speed and controls speed up to the closest one exmanded from the indoor unit within the range which open not exceed the specified value. Heating current release value 155AVI E. 6.30A 7.772A	(Ts) and room temperature (Ta)	
difference, the correction value of Hz signal which determines the compressor speed is set up. 3) The lotating position and speed of the motor are detected by the electronotive force occurred on the motor vinding with operation of the dompressor. 4) According to the difference resulted from comparison of the correction value of Hz signal with the present operation Hz, the inverter output and the commuta- tion timing are varied. 5) Change the compressor motor speed by outputting power to the compressor. *The contents of control operation are same in cooling operation and heating operation 1) The Input current of the autdoor. unit is elected in the inverter section of the outdoor unit. 2) According to the detected outdoo temperature, the specified value of the current value exceeds the specified value or not is judged. 4) If the current value exceeds the specified value, this function reduce the compressor speed and controls speed up to the closest one-commanded from the indoor unit within the range which does not exceed the specified value. Heating current release value 16530A 7.72A	is calcu lated.	
Hz signal which determines the compressor speed is set up. 3) The totaling position and speed of the motor are detected by the electromotive force occurred on the motor winding with operation of the dom pressor. 4) According to the difference resulted from comparison of the correction value of Hz signal with the present operation Hz, the inverter output and the commutation timing are varied. 5) Change the compressor motor speed by outputting power to the compressor. * The contents of control operation and heating operation and heating operation and heating operation. 1) The put current of the butdoor unit. 2) According to the detected outdoor temperature, the specified value of the current value exceeds the specified value with specified value in the current value exceeds the specified value, this function reduces the compressor speed and controls speed up to the closest one commanded from the indoor unit within the range which does not exceed the specified value. Heating current release value 165.30A 7.72A	2) According to the temperature	
compressor speed is set up. 3) The totating position and speed of the motor are detected by the electromotive force occurred on the motor winding with operation of the ombressor. 4) According to the difference resulted from comparison of the correction value of Hz signal with the present operation Hz, the inverter output and the commutation timing are varied. 5) Change the compressor motor speed by outputting power to the compressor. *The contents of control operation are same in cooling operation and heating operation and heating operation are same in cooling operation with its elected in the inverter section of the outdoor unit. 2) According to the detected outdoor temperature, the specified value of the current is selected. 3) Wheeher the current value exceeds the specified value, this function reduces the compressor speed and controls speed up to the closest ong-commanded from the indoor unit within the range which does not exceed the specified value. Heating current release value 16530AR F. 6.30A 7.72A	difference, the correction value of	
3) The totating position and speed of the motor are detected by the electro-notive force occurred on the motor winding with operation of the dompressor. 4) According to the difference resulted from comparison of the correction value of Hz signal with the present operation Hz, the inverter output and the commutation timing are varied. 5) Change the compressor motor speed by outputting power to the compressor. *The chitents of control operation and heating operation are same in cooling operation and heating operation and heating operation and heating operation it is elected in the inverter section of the outdoor unit. 2) According to the detected outdoor temperature, the specified value of the current is selected. 3) Whether the current value exceeds the specified value exceeds the specified value in the inverter specified value or ont is judged. 4) If the current value exceeds the specified value, this function reduces the compressor speed and controls speed up to the closest one commanded from the indoor unit within the range which does not exceed the specified value. Heating current release value 16530AR 7.72A	Hz signal which determines the	
of the motor are detected by the electromotive force occurred on the motor winding with operation of the dompressor. 4) According to the difference resulted from comparison of the correction value of Hz signal with the present operation Hz, the inverter output and the commutation timing are varied. 5) Change the compressor motor speed by outputting power to the compressor. **The contents of control operation are same in cooling operation are same in cooling operation and heating operation 1) The Input current of the outdoor unit is detected in the inverter section of the outdoor unit. 2) According to the detected outdoor temperature, the specified value of the current value exceeds the specified value, this function reduces the compressor speed and controls speed up to the closest one commanded from the indoor unit within the range which does not exceed the specified value. Heating current release value 1653VR-E 6.30A 7.72A	compressor speed is set up.	
electro notive force occurred on the moor winding with operation of the ombressur. 4) According to the difference resulted from comparison of the correction value of Hz signal with the present operation Hz, the inverter output and the commutation timing are varied. 5) Change the compresson motor speed by outputting power to the compressor. *The contents of control operation and heating operation of the outdoor unit. 2) According to the detected outdoor temperature, the specified value of the current value exceeds the specified value or not is judged. 4) If the current value exceeds the specified value or not is judged. 4) If the current value exceeds the specified value or not is judged. 4) If the current value exceeds the specified value, this function reduces the compressor speed and controls speed up to the closest ong commanded from the indoor unit within the range which does not exceed the specified value. Heating current release value 1653VR E 6.30A 7.72A	3) The rotating position and speed	
the motor winding with operation of the dompressor. 4) According to the difference resulted from comparison of the correct on value of Hz signal with the present operation Hz, the inverter output and the commutation timing are varied. 5) Change the compressor motor speed by outputting power to the compressor. * The contents of control operation and heating operation and heating operation and heating operation of the outdoor unit is detected in the inverter section of the outdoor unit. 2) According to the detected outdoo temperature, the specified value of the current value exceeds the specified value or not is judged. 4) If the current value exceeds the specified value, this function reduces the compressor speed and controls speed up to the closest ong commanded from the indoor unit within the range which obes not exceed the specified value. Heating current release value 1653VRFE 6.330A 7.72A	of the motor are detected by the	
of the dompressor. 4) According to the difference resulted from comparison of the correct on value of Hz signal with the present operation Hz, the inverter output and the commutation timing are varied. 5) Change the compressor motor speed by outputting power to the compressor. * The contents of control operation are same in cooling operation are same in cooling operation and heating operation in the outdoor unit. 1) The input current of the butdoor unit is detected in the inverter section of the outdoor unit. 2) According to the detected outdoor temperature, the specified value of the current value exceeds the specified value of the current value exceeds the specified value, this function reduces the compressor speed and controls speed up to the closest one commanded from the indoor unit within the range which does not exceed the specified value. Heating current release value 165304 F. 7.72A	electro motive force occurred on	
4) According to the difference resulted from comparison of the correction value of Hz sign with the present operation Hz, the inverter output and the commutation timing are varied. 5) Change the compressor motor speed by outputting power to the compressor. * The contents of control operation are same in cooling operation and heating operation and heating operation of the outdoor unit is detected in the inverter section of the outdoor unit. 2) According to the detected outdoor temperature, the specified value of the current is selected. 3) Whether the current value exceeds the specified value, this function reduces the compressor speed and controls speed up to the closest one commanded from the indoor unit within the range which does not exceed the specified value. Heating current release value 165304 F. 630A 7.72A	the motor winding with operation	
resulted from comparison of the correction value of Hz signal with the present operation Hz, the inverter output and the commutation timing are varied. 5) Change the compressor motor speed by outputting power to the compressor. *The contents of control operation are same in cooling operation and heating operation 1) The input current of the autdoor unit is detected in the inverter section of the outdoor unit. 2) According to the detected outdoor temperature, the specified value of the current is selected. 3) Whether the current value exceeds the specified value, this function reduces the compressor speed and controls speed up to the closest on examination of the compressor speed and controls speed up to the closest on examination of the compressor speed and controls speed up to the closest on examination of the compressor speed and controls open and the compressor speed and controls open on the compressor speed on the compre	of the compressor.	
correct on value of Hz signal with the present operation Hz, the inverter output and the commuta- tion timing are varied. 5) Change the compressor motor speed by outputting power to the compressor. * The contents of control operation are same in cooling operation 1) The nput current of the butdoor unit is detected in the inverter section of the outdoor unit. 2) According to the detected outdoor temperature, the specified value of the current value exceeds the specified value or not is judged. 4) If the current value exceeds the specified value, this function reduces the compressor speed and controls speed up to the closest one commanded from the indoor unit within the range which does not exceed the specified value. Heating current release value 165AVP-E 6.30A 7.72A	4) According to the difference	
the present operation Hz, the inverter output and the commuta- tion timing are varied. 5) Change the compressor motor speed by outputting power to the compressor. * The chitents of control operation are same in cooling operation 1) The input current of the outdoor unit is detected in the inverter section of the outdoor unit. 2) According to the detected outdoor temperature, the specified value of the current is selected. 3) Wheher the current value exceeds the specified value or not is judged. 4) If the current value exceeds the specified value, this function reduces the compressor speed and controls speed up to the closest one commanded from the indoor unit within the range which does not exceed the specified value. Heating current release value 165AVH-E 6.30A 7.72A	resulted from comparison of the	
inverter output and the commutation timing are varied. 5) Charge the compressor motor speed by outputting power to the compressor. * The contents of control operation are same in cooling operation and heating operation. 1) The nput current of the autdoor unit is detected in the inverter section of the outdoor unit. 2) Accdrding to the detected outdoor temperature, the specified value of the current value exceeds the specified value or not is judged. 3) Whether the current value exceeds the specified value, this function reduces the compressor speed and controls speed up to the closest one commanded from the indoor unit within the range which does not exceed the specified value. Heating current release value 165AVP-E 6.30A 7.72A	correct on value of Hz signal with	
tion tin ing are varied. 5) Change the compressor motor speed by outputting power to the compressor. * The contents of control operation are same in cooling operation and heating operation. 1) The nput current of the butdoor unit is detected in the inverter section of the outdoor unit. 2) Accdrding to the detected outdoor temperature, the specified value of the current is selected. 3) Whether the current value exceeds the specified value, this function reduces the compressor speed and controls speed up to the closest one commanded from the indoor unit within the range which does not exceed the specified value. Heating current release value 165AVP-E 6.30A 7.72A	the present operation Hz, the	
5) Change the compressor motor speed by outputting power to the compressor. * The contents of control operation are same in cooling operation 1) The input current of the butdoor unit is detected in the inverter section of the outdoor unit. 2) According to the detected outdoor temperature, the specified value of the current is selected. 3) Whether the current value exceeds the specified value or not is jiudged. 4) If the current value exceeds the specified value, this function reduces the compressor speed and controls speed up to the closest one commanded from the indoor unit within the range which does not exceed the specified value.
